Continuation of 5. does NOT place the application in condition for allowance because: The argument that there is no motivation to combine or suggestion to combine the features of Nakanishi with Yamanaka is moot because: both Nakanishi and Yamanaka disclose a projection image display and a liquid crystal projector and teach various ways of improving image quality. Yamanaka addresses the thermal issues associated with an intense light from a light source and Nakanishi addresses the light collecting issues. Proper management of thermal issues will be more critical in the case when microlenses are used. Hence, the Examiner feels that it is proper to combine the teachings of the two references to prevent degradation of a displayed image quality.

Nakanishi also teaches the condensing of light by the microlenses impinging upon the liquid crystal layer (Fig. 4) and the diverging of the light emitted from the liquid crystal layer due to the action of the microlenses. It can clearly be seen that the thickness of the substrate containing microlenses(entrance side) is thicker than the exit side substrate.
